CTS Imaging and CTS Imaging/Exposure Systems

M&R’s i-Image series of computer-to-screen (CTS) imaging and imaging-exposure systems are the most popular and versatile line of CTS machines in the industry. All i-Image Series systems use specially-formulated, water-based UV-blocking ink and advanced high-resolution CTS inkjet printer technology to quickly generate opaque images on emulsion-coated screens. CTS images are superior to traditional film positives by delivering greater detail and smoother halftone transitions. i-Image Series systems eliminate the need for costly film positives, as well as the space and labor required to store and retrieve them. Because the image information is digital, it’s easy to store and quick to retrieve.

All i-Image models are fully integrated with M&R’s Tri-Sync™ system to deliver exact image placement.

- i-Image S, i-Image ST & i-Image K generate computer-to-screen images for subsequent exposure on standalone exposure units.
- i-Image XE and i-Image KX expose emulsion with a scanning UV LED light source.
- All i-Image models come complete with computer system, proprietary RIP software, and Tri-Sync pallet.

i-Image S™ Computer-to-Screen (CTS) Imaging System
The single-printhead i-Image S is ideal for smaller shops where throughput and price point are key considerations. It’s the best solution for screen printers who need a frame size of 66 x 91 cm (26" x 36") or less, and process fewer than 100 screens per 8-hour shift. Without on-board exposing, the price point is kept to a minimum, allowing customers to use their existing standalone exposure units. This can actually help to increase throughput by getting the imaged screen off the printer faster, allowing the operator to quickly load and image the next screen. The i-Image S is designed to fit through an 81 cm (32") doorway, and comes complete with computer, monitor, and proprietary software that gives operators complete control of all print parameters.

i-Image ST™ Computer-to-Screen (CTS) Imaging System
The i-Image ST is available in two sizes, with maximum frame sizes of 66 x 91 cm (26" x 36") or 66 x 109 cm (26" x 43") Both ST models support either one, two or three printhead configurations. The ST produces screens incredibly fast, while off-unit exposing allows customers to use their existing standalone exposure units. This can actually help to increase throughput by getting the imaged screen off the printer faster, allowing the operator to quickly load and image the next screen. The i-Image ST is designed to fit through an 81 cm (32") doorway, and comes complete with a computer, monitor, and proprietary software that gives operators complete control of all print parameters.

i-Image STE I™ Computer-to-Screen (CTS) Imaging-Exposure System
The i-Image STE I is M&R’s high-speed imaging-exposure system. It is available in two sizes, with maximum frame sizes of 66 x 91 cm (26" x 36") or 66 x 109 cm (26" x 43") Both models support either one, two or three printhead configurations. Imaging and exposure are amazingly fast—one-printhead i-Image STE I systems can image and expose up to 150 screens per 8-hour shift; two-printhead models can image and expose up to 300 screens per shift; and three-printhead models can image and expose up to 450 screens per shift*. In fact, three-printhead models can generate and expose full-size images in less than a minute. The i-Image STE I is designed to fit through an 81 cm (32") doorway, and comes complete with a computer, monitor, and proprietary software that gives operators complete control of all print parameters.

i-Image K™ and KX™ Computer-to-Screen (CTS) Imaging and Imaging-Exposure Systems
The large format i-Image KX supports a 83 x 121 cm (33" x 48") frame size and dramatically reduces the time and effort required to prepare imaged screens by combining CTS imaging and UV LED screen exposure in one machine. A shuttling gantry design minimizes floor space, while a wide, single printhead provides fast imaging speeds and tremendous detail that is superior to traditional film positive-processed screens. After imaging, KX models scan the imaged screen with a high-output UV LED array to expose the emulsion, which produces screens that can be taken directly to washout. i-Image K has all the imaging features and capabilities of i-Image KX without the exposure capability. The i-Image K and KX are designed to fit through a 185 cm (73") doorway, and come complete with a computer, monitor, and proprietary software that gives operators complete control of all print parameters.

i-Image XE™ Computer-to-Screen (CTS) Imaging-Exposure System
The i-Image XE is M&R’s oversize CTS system. It’s ideal for imaging and exposing oversize screens for textile screen printing as well as for imaging and exposing multiple textile screens simultaneously. It’s also suitable for some graphics applications. Maximum screen size is 152 x 152 cm (60" x 60") and maximum image area is 132 x 132 cm (52" x 52").

Tri-SYNCTM for Computer-to-Screen (CTS) Imaging Systems
M&R’s Tri-Sync System ensures that every CTS-generated screen is precisely pre-registered by way of conductive contact points that illuminate the print button when all contact points are engaged, alerting the operator that it is safe to image the screen. The included on-press Tri-Sync pallet offers similar conductive contact points that illuminate small LED lights that notify the operator the screen is engaged correctly and is safe to lock into place. Visual confirmation takes the guesswork out of correct screen placement, and ensures the most accurate imaging and the fastest on-press screen setups possible.

*Approximate number of screens the model is capable of printing in an 8-hour shift. Your results may vary.
Fast, high-quality screen printing starts with high-quality screens, and M&R’s Digital Screen Room concept is dedicated to dramatically reducing screen production time while making substantial improvements to image quality and consistency.
